# METHOD OF TREATING OR PREVENTING BIOLOGICAL OR IMMUNOLOGICAL RESPONSES TO A REACTIVE CHEMICAL OR BIOLOGICAL OR TOXIC AGENT

## CROSS-REFERENCE TO RELATED APPLICATION

[0001] This application claims the benefit of U.S. Provisional Application Serial No. 60/530,893, filed December 22, 2003.

#### BACKGROUND OF THE INVENTION

Field of the Invention

15

[0002] The present invention relates to the field of treating or preventing biological or immunological response to a reactive chemical or biological agent.

10 Description of the Background Art

[0003] Contact dermatitis and other allergic reactions due to chemical or biological skin sensitizing agents, environmental toxins or irritants can cause redness, swelling, induration, rashes, blisters, burns, inflammation or eczema skin changes in humans.

[0004] Although many treatments have been proposed for such maladies, there remains a need in the art for improved methods and compositions for treating or preventing the erythema, redness, swelling, induration, rashes, itching, blisters and /or inflammation due to the physiological and immunological responses to reactive chemicals, biological agents, or toxins.

#### SUMMARY OF THE INVENTION

[0005] In accordance with one aspect, a method of treatment for treating, preventing, inhibiting or reducing a biological or immunological response to a reactive chemical agent, biological agent or toxin, by tissue of a subject, comprises administering to a subject in need of such treatment an effective amount of a composition comprising a response-inhibiting agent comprising amino acid sequence LKKTET, a conservative variant thereof, or an agent that stimulates production of an LKKTET peptide, or a conservative variant thereof, in said tissue, so as to inhibit said response.

### DETAILED DESCRIPTION OF THE INVENTION

[0006] Without being found to any specific theory, actin-sequestering peptides such

as thymosin beta 4 (TB4 or TB4) and other response-inhibiting agents including actinsequestering peptides or peptide fragments containing amino acid sequence LKKTET or conservative variants thereof, promote reversal or prevention of a biological or immunological response from exposure to a reactive chemical agent, biological agent or toxin. The invention is applicable to conditions including, but not limited to, the following: biological or immunological responses of surface tissues such as skin or mucous membranes, dermatologic and other disorders due to allergic reactions, reactions to chemicals and toxins, contact dermatitis, and reactions to plants including, but not limited to, poison ivy, poison oak, and poison sumac; bites of insects including, but not limited to, mosquitoes, fire ants, chiggers, ticks, bees, spiders, fleas and flies; bites of reptiles, especially venomous reptiles, amphibians, and other animals; contact with various animals with venom on their skin such as poisonous frogs; and allergic reactions of the pulmonary and gastrointestinal systems. The invention is also applicable to skin sensitizing agents, psoriasis, atopic dermatitis and eczemas and other conditions that may present with scaling patches and plaques or with bullous and vesicular changes. The invention is also applicable to occupational allergic contact dermatitis, such as but not limited to nickel-associated dermatitis.

30

[0007] Thymosin 4 was initially identified as a protein that is up-regulated during endothelial cell migration and differentiation *in vitro*. Thymosin 4 was originally isolated from the thymus and is a 43 amino acid, 4.9 kDa ubiquitous polypeptide identified in a variety of tissues. Several roles have been ascribed to this protein including a role in a endothelial cell differentiation and migration, T cell differentiation, actin sequestration, vascularization and wound healing.

[0008] In accordance with one embodiment, the invention is a method of treatment for treating, preventing, inhibiting or reducing a biological or immunological response to a reactive chemical agent, biological agent or toxin, by tissue of a subject, comprising administering to a subject in need of such treatment an effective amount of a composition comprising a biological or immunological response-inhibiting agent, which may be a polypeptide comprising amino acid sequence LKKTET, or a conservative variant thereof having biological or immunological response-inhibiting activity, preferably Thymosin  $\beta 4$ , and/or  $T\beta 4$  isoforms, analogues or derivatives, including KLKKTET, LKKTETQ, oxidized  $T\beta 4$ ,  $T\beta 4$  sulfoxide, N-terminal variants of  $T\beta 4$ , C-terminal variants of  $T\beta 4$  and antagonists of  $T\beta 4$ .

[0009] Compositions which may be used in accordance with the present invention

include agents such as Thymosin β4 (Tβ4), and/or Tβ4 isoforms, analogues or derivatives, including oxidized Τβ4, Τβ4 sulfoxide, N-terminal variants of Τβ4, Cterminal variants of Tβ4 and antagonists of Tβ4, polypeptides or peptide fragments comprising or consisting essentially of the amino acid sequence LKKTET or conservative variants thereof, having biological or immunological response-inhibiting activity. International Application Serial No. PCT/US99/17282, incorporated herein by reference, discloses isoforms of Tβ4 which may be useful in accordance with the present invention as well as amino acid sequence LKKTET and conservative variants thereof having biological or immunological response-inhibiting activity, which may be utilized with the present invention. International Application Serial No. PCT/GB99/00833 (WO 99/49883), incorporated herein by reference, discloses oxidized Thymosin β4 which may be utilized in accordance with the present invention. Although the present invention is described primarily hereinafter with respect to  $T\beta4$  and  $T\beta4$ isoforms, it is to be understood that the following description is intended to be equally applicable to amino acid sequence LKKTET, peptides and fragments comprising or consisting essentially of LKKTET, conservative variants thereof having biological or immunological response-inhibiting activity, and/or Tβ4 isoforms, analogues or derivatives, including oxidized Tβ4, Tβ4 sulfoxide, N-terminal variants of Tβ4, Cterminal variants of Tβ4 and antagonists of Tβ4.

30

[0010] In one embodiment, the invention provides a method of treatment for treating, preventing, inhibiting or reducing a biological or immunological response to a reactive chemical agent, biological agent or toxin, by tissue of a subject, by contacting the tissue with a biological or immunological response-inhibiting effective amount of a composition which contains a response-inhibiting agent as described herein. As non-limiting examples, the tissue may be selected from a surface tissue such as skin or a mucous membrane of said subject, pulmonary tissue of said subject or gastrointestinal tissue of said subject. The contacting may be topically or systemically. Examples of topical administration include, for example, contacting the skin with a lotion, salve, gel, cream, paste, spray, suspension, dispersion, hydrogel, ointment, or oil comprising a response-inhibiting agent as described herein. Systemic administration includes, for example, intravenous, intraperitoneal, intramuscular injections of a composition containing a response-inhibiting agent as described herein, in a pharmaceutically acceptable carrier such as water for injection.

[0011] Response-inhibiting agents for use in the invention, as described herein, may be administered in any suitable biological or immunological response-inhibiting amount. For example, a response-inhibiting agent as described herein may be administered in dosages within the range of about 0.001-1,000,000 micrograms, more preferably in amounts within the range of about 0.1-5,000 micrograms, most preferably within the range of about 1-25 micrograms.

[0012] A composition in accordance with the present invention can be administered daily, every other day, etc., with a single application or multiple applications per day of administration, such as applications 2, 3, 4 or more times per day of administration.

[0013] Many T $\beta$ 4 isoforms have been identified and have about 70%, or about 75%, or about 80% or more homology to the known amino acid sequence of T $\beta$ 4. Such isoforms include, for example, T $\beta$ 4<sup>ala</sup>, T $\beta$ 9, T $\beta$ 10, T $\beta$ 11, T $\beta$ 12, T $\beta$ 13, T $\beta$ 14 and T $\beta$ 15. Similar to T $\beta$ 4, the T $\beta$ 10 and T $\beta$ 15 isoforms have been shown to sequester actin. T $\beta$ 4, T $\beta$ 10 and T $\beta$ 15, as well as these other isoforms share an amino acid sequence,

10

15

20

25

30

LKKTET, that appears to be involved in mediating actin sequestration or binding. Although not wishing to be bound to any particular theory, the activity of T $\beta$ 4 isoforms may be due, in part, to the ability to polymerize actin. For example, T $\beta$ 4 can modulate actin polymerization in skin (e.g.  $\beta$ -thymosins appear to depolymerize F-actin by sequestering free G-actin). T $\beta$ 4's ability to modulate actin polymerization may therefore be due to all, or in part, its ability to bind to or sequester actin via the LKKTET sequence. Thus, as with T $\beta$ 4, other proteins which bind or sequester actin, or modulate actin polymerization, including T $\beta$ 4 isoforms having the amino acid sequence LKKTET, are likely to be effective, alone or in a combination with T $\beta$ 4, as set forth herein.

[0014] Thus, it is specifically contemplated that known T $\beta$ 4 isoforms, such as T $\beta$ 4 <sup>ala</sup>, T $\beta$ 9, T $\beta$ 10, T $\beta$ 11, T $\beta$ 12, T $\beta$ 13, T $\beta$ 14 and T $\beta$ 15, as well as T $\beta$ 4 isoforms not yet identified, will be useful in the methods of the invention. As such T $\beta$ 4 isoforms are useful in the methods of the invention, including the methods practiced in a subject. The invention therefore further provides pharmaceutical compositions comprising T $\beta$ 4, as well as T $\beta$ 4 isoforms T $\beta$ 4 and T $\beta$ 9, T $\beta$ 10, T $\beta$ 11, T $\beta$ 12, T $\beta$ 13, T $\beta$ 14 and T $\beta$ 15, and a pharmaceutically acceptable carrier.

[0015] In addition, other response-inhibiting agents or proteins having actin sequestering or binding capability, or that can mobilize actin or modulate actin polymerization, as demonstrated in an appropriate sequestering, binding, mobilization

or polymerization assay, or identified by the presence of an amino acid sequence that mediates actin binding, such as LKKTET, for example, can similarly be employed in the methods of the invention. Such proteins include gelsolin, vitamin D binding protein (DBP), profilin, cofilin, depactin, Dnasel, vilin, fragmin, severin, capping protein,  $\beta$ -actinin and acumentin, for example. As such methods include those practiced in a subject, the invention further provides pharmaceutical compositions comprising gelsolin, vitamin D binding protein (DBP), profilin, cofilin, depactin, Dnasel, vilin, fragmin, severin, capping protein,  $\beta$ -actinin and acumentin as set forth herein. Thus, the invention includes the use of an EB-inhibiting polypeptide comprising the amino acid sequence LKKTET and conservative variants thereof.

10

15

20

25

30

[0016] As used herein, the term "conservative variant" or grammatical variations thereof denotes the replacement of an amino acid residue by another, biologically similar residue. Examples of conservative variations include the replacement of a hydrophobic residue such as isoleucine, valine, leucine or methionine for another, the replacement of a polar residue for another, such as the substitution of arginine for lysine, glutamic for aspartic acids, or glutamine for asparagine, and the like. [0017] Tβ4 has been localized to a number of tissue and cell types and thus, agents which stimulate the production of an LKKTET peptide such as Tβ4 or another response-inhibiting agent as described herein, can be added to or comprise a composition to effect production a response-inhibiting agent from a tissue and/or a cell. Such stimulating agents include members of the family of growth factors, such as insulin-like growth factor (IGF-1), platelet derived growth factor (PDGF), epidermal growth factor (EGF), transforming growth factor beta (TGF-β), basic fibroblast growth factor (bFGF), thymosin  $\alpha 1$  (T $\alpha 1$ ) and vascular endothelial growth factor (VEGF). More preferably, the stimulating agent is transforming growth factor beta (TGF-β) or other members of the TGF-β superfamily. Compositions of the invention may reduce the affects of biological or immunological response to a reactive chemical or biological

[0018] In accordance with one embodiment, subjects are treated with a stimulating agent that stimulates production in the subject of a biological or immunological response-inhibiting agent as defined herein.

agent by effectuating growth of the connective tissue through extracellular matrix

deposition, cellular migration and vascularization.

[0019] Additionally, other agents that assist in reduction of biological or immunological response to a reactive chemical agent, biological agent or toxin may be added to a

composition along with a response-inhibiting agent as described herein. Such other agents include angiogenic agents, growth factors, agents that direct differentiation of cells, agents that promote migration of cells and agents that stimulate the provision of extracellular matrix material in the tissue. For example, and not by way of limitation, a response-inhibiting agent as described herein alone or in combination can be added in combination with any one or more of the following agents: VEGF, KGF, FGF, PDGF, TGFβ, IGF-1, IGF-2, IL-1, prothymosin α and/or thymosin α1 in an effective amount. [0020] The invention also includes a pharmaceutical composition comprising a therapeutically effective amount of a response-inhibiting agent as described herein in a pharmaceutically acceptable carrier. Such carriers include those listed herein. [0021] The actual dosage or reagent, formulation or composition that provides treatment for treating, preventing, inhibiting or reducing a biological or immunological response to a reactive chemical agent, biological agent or toxin, by tissue of a subject, may depend on many factors, including the size and health of a subject. However, persons of ordinary skill in the art can use teachings describing the methods and techniques for determining clinical dosages as disclosed in PCT/US99/17282, supra, and the references cited therein, to determine the appropriate dosage to use. [0022] Suitable formulations may include a response-inhibiting agent as described herein at a concentration within the range of about 0.001 - 50% by weight, more preferably within the range of about 0.01 - 0.1% by weight, most preferably about 0.05% by weight.

10

15

20

25

30

[0023] The therapeutic approaches described herein involve various routes of administration or delivery of a response-inhibiting agent as described herein, including any conventional administration techniques (for example, but not limited to, topical administration, local injection, inhalation, or systemic administration), to a subject. The methods and compositions using or containing a response-inhibiting agent as described herein may be formulated into pharmaceutical compositions by admixture with pharmaceutically acceptable non-toxic excipients or carriers.

[0024] The invention includes use of antibodies which interact with a response-inhibiting agent as described herein. Antibodies which consist essentially of pooled monoclonal antibodies with different epitopic specificities, as well as distinct monoclonal antibody preparations are provided. Monoclonal antibodies are made from antigen containing fragments of the protein by methods well known to those skilled in the art as

disclosed in PCT/US99/17282, *supra*. The term antibody as used in this invention is meant to include monoclonal and polyclonal antibodies.

[0025] In yet another embodiment, the invention provides a method of treating a subject by administering an effective amount of stimulating agent which modulates gene expression. The term "modulate" refers to inhibition or suppression of expression when a response-inhibiting agent as described herein is over expressed, and induction of expression when a response-inhibiting agent as described herein is underexpressed. The term "effective amount" means that amount of stimulating agent which is effective in modulating gene expression of a response-inhibiting agent as described herein, resulting in reducing the symptoms of the biological or immunological response to a reactive-chemical agent, biological agent or toxin. A stimulating agent which modulates gene expression of a response-inhibiting agent as described herein may be a polynucleotide, for example. The polynucleotide may be an antisense, a triplex agent, or a ribozyme. For example, an antisense directed to the structural gene region or to the promoter region of a response-inhibiting agent as described herein may be utilized. The stimulating agent which modulates gene expression of a response-inhibiting agent as described herein may be utilized.

10

15

20

25

30

[0026] In another embodiment, the invention provides a method for utilizing compounds that modulate activity of a response-inhibiting agent as described herein.

Compounds that affect activity of a response-inhibiting agent as described herein (e.g., antagonists and agonists) include peptides, peptidomimetics, polypeptides, chemical compounds, minerals such as zincs, and biological agents.

[0027] The invention further relates to a method of screening for a response-inhibiting agent as described herein, comprising contacting a tissue exhibiting a biological or immunological response, with a candidate compound; and measuring a level of reduction of the biological or immunological response in said tissue, wherein a reduction of said level compared to a level in a corresponding tissue lacking said candidate compound indicates that said compound is capable of treating, preventing, inhibiting or reducing the biological or immunological response.

[0028] The invention further relates to a method of screening for a response-inhibiting agent as described herein, comprising contacting a tissue with a candidate compound; contacting the tissue with a substance which induces a biological or immunological response in said tissue in the absence of said candidate compound; and measuring a level of reduction of the biological or immunological response in said tissue, wherein a

reduction of said level compared to a level in a corresponding tissue lacking said candidate compound indicates that said compound is capable of treating, preventing, inhibiting or reducing the biological or immunological response.

[0029] The invention still further relates to a method for screening for a stimulating agent as described herein capable of stimulating production in a tissue of a responseinhibiting agent as described herein, comprising contacting a tissue exhibiting a biological or immunological response as described herein, with a candidate compound; and measuring activity in said tissue of Tβ4 or another response-inhibiting agent as described herein, wherein an increase of activity of Tβ4 or another response-inhibiting agent as described herein, in said tissue, compared to a level of activity of such response-inhibiting agent in a corresponding tissue lacking said candidate compound. indicates that said compound is capable of inducing said stimulating agent. [0030] The invention further relates to a method of screening for a stimulating agent as described herein capable of stimulating production of a response-inhibiting agent as described herein in a tissue, comprising contacting a tissue with a candidate compound, contacting the tissue with a substance that induces a biological or immunological response in said tissue in the absence of said candidate compound; and measuring activity in said tissue of a response-inhibiting agent as described herein, wherein an increase of activity in said tissue of a response-inhibiting agent as described herein, compared to a level of said activity in a corresponding tissue lacking said candidate compound, indicates that said candidate compound is capable of stimulating
